Website: http://www2.pnwx.com .

The following are looked for in evaluating the UI of a webpage: Navigation, Website Layout, Color choices & Visibility, Font Size, Responsiveness, Security, Search Bar, Functionality, Buttons & Links, and Content Quality.

I didn't find the website navigation to be user friendly. It has many links that are leading to different X-Ray product sites, and finding the way back from other pages is becoming difficult. A structured navigation menu should be implemented in order to improve the user experience.

I found it difficult to understand the website layout in the first attempt because it is not having a proper header, footer, or content. The website should update its layout by implementing separate sections and navigation tools for better clarity.

The website has a dark background, poor contrast and multiple font styles making it hard for me to read the content. The text and images are also not aligned properly which is further affecting the visual experience. To avoid all these the color contrast ratio should be improved, for standard text the contrast ratio should be minimum 5:1 and it is also important to ensure that the font size is appropriate for all screen sizes.

The search bar on the top confused me in the beginning, a dark arrow is pointing to the search bar and there is no "search" label in it. The website requires a well-defined search bar. The website should explain its purpose clearly, I feel that this website lacks this. For example, Website mentions that users can purchase items using the site but to purchase items the customer needs to email them with the list of items they want. When customers are unable to place orders through the website, I don't understand the point of listing multiple payment methods on the website.

The website is not responsive to different screen sizes and causing issues with content alignment and font size. It requires a responsive design that can adapts itself to different screen sizes. There is no login option on the website, which raises concerns about user accessing his/her account and his/her past orders placed. The site should add a user account section to the home page for easy access.

The website uses HTTP, which is not secure, this makes the website prone to cyber-attacks such as SQL-Injection attacks, fuzzing, DDoS (Distributed Denial-of Service) …etc. Instead of "http://," using "https://" will improve the data security and user trust. The website has malicious content or many advertisements.

The website's logo is not redirecting to the home page and there are a few other links that are not navigating to other pages. To improve the user-experience the above-mentioned changes are needed to be implemented in the website.

Website: (historianofthefuturex.com)

I looked for the following to evaluate the user interface of this webpage: : Navigation, Layout, Color choices and Visibility, Font Size, Response to different screens, Security, Search Function, Functionality, Buttons and links, and Content Quality.

The website's navigation is not very user-friendly. Only a few logos are directed to other pages, while others do not, clicking the title does not redirect to the home page, which confuses users on how to use the website. In order to avoid these, implement a clear and consistent navigation menu that assists users in browsing various sections of the website.

The website's dark background contrasts with the text color of the header attributes, which affects the visibility of the login attribute. To improve the readability, replace the background image with the one with high contrast with the text color of the header attributes.

It is challenging to read the text due to font size and color issues. To improve the readability, use a legible font and ensure a color contrast ratio, a minimum of 5:1 for standard text.

The website is secure from SQL injection attacks, fuzzing, DDoS (Distributed Denial-of-Service) …etc, because it uses https://. Regular updates are required to prevent data breaches and vulnerabilities.

The website is not responsive to small-screen devices (mobiles, tablets). In these small devices, the page does not fit to the screen which is making difficult to navigate through the website. The website should be redesigned such that it increases the responsiveness so that it can be viewed on different screen sizes.

There is no search bar in the website which makes the users life difficult to search for the specific content. This leads to poor user experience and sometimes users might leave the site in frustration. In order to avoid a search bar must be implemented that has advanced search filters and it should be more user friendly. Site visitors find it difficult to understand the website due to the poor navigation menu and also due to the animations blurring the content when text scrolling over it. The animations must be reevaluated so that they don't interfere with the readability of the content.

Follow-me and Copy-right buttons are not redirecting to any other pages. Follow-me buttons seem appropriate at the bottom because the Facebook and LinkedIn logos are present anyway. Follow-me must be removed, or Facebook and LinkedIn should be removed from the footer.
